**INFORMATION DISCLOSURE STATEMENT
PURSUANT TO 37 C.F.R. SECTION 1.97**

Mail Stop DD
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313

Dear Sir/Madam:

Pursuant to 37 C.F.R. § 1.97, the following Information Disclosure Statement is submitted as listed on form PTO-1449 enclosed herewith in duplicate. Copies of all disclosure documents were previously provided by Applicant or were otherwise made of record during prosecution of the parent patent application Serial No. 09/801,194, filed 03/08/2001.

The disclosure documents listed on the attached form PTO-1449 were printed in the English language and/or accompanied by an Abstract published in the English language. The relevance of any non-English language references is explained in the abstract, or in the accompanied PCT search reports, and/or by comments provided below:

DE 2530045 C2 describes a motor with a stator and a rotor where the stator has at least one piezoelectric resonator that has a friction contact to the rotor. The resonator has at least one piezoelectric element attached to the parallel surfaces of the resonator. The piezoelectric element is connected to an AC-voltage source. The polarization of the piezoelectric element is perpendicular to the electrode surface. The dimension of the resonator is designed to have a longitudinal resonance that is close to the frequency of the AC voltage. The resonator is in

driving communication with the rotor, so that the contact to the rotor causes bending or transversal vibrations that together drive the rotor.

DE 3309239 C2 discloses a piezoelectric motor with two resonators each having a separate resonant frequency defined by the dimensions of the respective resonator. The frequencies are sufficiently close to produce a mechanical phase shift in the resonators so that no electric difference of the input signal 8 is necessary.

DE 3833342 A1 describes a piezoelectric motor providing two selectable driving directions and a holding mode, comprising one driving element (2, 33, 133, 233) that generates mutually orthogonal motion components (L, T) with selectable mutual phases (0° , 180° , 190°).

DE 3920726 C2 describes an ultrasonic oscillator 1 with piezoelectric elements 2. A resonator 4 is connected to the piezoelectric elements 2. The resonator has one or several slanted surfaces 9 wherein at the front end of resonator 4 elliptic oscillations are generated. The ultrasonic oscillator 1 can be used as a driver of a motor 20 that has a rotor 22.

DE 19928780 discloses a piezoelectric actuator configuration.

EP 0231940 A2 shows a piezoelectric drive used as a motor (Fig. 1) or mist generator (Fig. 2), and uses two masses (2 & 3) connected by a tube shaped part 6 that encloses the piezoceramic body 4.

EP 0643427 B1 has claims written in English. Claim 1 refers to an electric motor with at least one pair of transducers (1, 1, 1', 2', 101, 102) each comprising a vibrating element. These transducers are located collinearly in order to generate longitudinal vibrations in the direction of the axis of alignment, in permanent contact via one of their ends with a support structure (70, 15, 24, 38, 39, 46, 51, 60, 66, 104, 107) and via the other one of their ends with an elastic coupling means (3, 3', 103) to which the vibrations of the two transducers are applied. The transducers are excited so that their vibrating elements vibrate at one and the same frequency, depending on the alignment of the transducers, but with a phase shift of 90° , and at least one element (4, 10, 11, 25, 36, 37, 49, 50, 62, 63, 106) frictionally driven by the coupling means whose zone of contact with the driven element is given a circular or elliptical movement, motor wherein the coupling means is an elastic component in contact at two opposed points with the transducers, and exhibiting symmetry relative to a plane perpendicular to the line of action of the transducers and a section, along a plane containing this line of action, of at least approximately elliptical, particularly circular or semi-elliptical shapes.

SU 1278994 shows a mounting arrangement for vibratory motors.

An article by W. Krause and W. Schinkothe, titled "Lineardirektantriebe für die Feinwerktechnik [Direct-Drive Linear Motors in Precision Engineering]", which was published in *Feinwerktechnik & Messtechnik [Precision Engineering and Measurement Engineering]*, Issue 98, No. 7-8, Munich, 1990. It describes a piezoelectric linear motor.

Please note that this is filed concurrently with one or more additional Information Disclosure Statements which were filed electronically on the same date. Attached is an Acknowledgement Receipt: reference EFS ID **57663**.

No representation is made that the references disclosed herein legally constitute prior art, or that more relevant references are not available. The references listed herein, when taken alone or in combination, are not believed to disclose nor make obvious the invention as claimed in the subject application.

As this Information Disclosure Statement is being submitted before the stipulated three months from the filing date of the application and/or before the mailing of a first Office Action, it is believed that no fee is required. If any additional fee is required, please charge Account Number 19-4330.

Respectfully submitted,

Dated: 3/23/01
